

COVID-19 RESPONSE PLAN

The health and safety of our crews, clients and all people involved with the Jet 60 operation is our number one priority. We understand the critical nature of health and safety during this time. With the dynamic nature of the coronavirus outbreak, we must be flexible in how we respond, provide service, and protect our customers and employees. We are following the recommendations and guidance from the Centers for Disease Control and Prevention (CDC), World Health Organization (WHO), the Transportation Security Association (TSA), the Federal Aviation Administration (FAA) and, the National Business Aviation Association (NBAA). We have implemented the following precautionary measures and guidelines in response to the coronavirus.

Crew training:

- Crews have been trained on the recognition of sick passengers and how to handle passengers that show signs of sickness in-flight.
- Crews have been trained with additional health related company SOP's that help protect themselves and passengers.
- Crews have been provided guidance for additional pre and post cleaning/disinfecting procedures recommended by the CDC and FAA.
- Crews have been instructed to self-quarantine in hotels and to minimize exposure to others while on the road.
- Crews will restrict physical contact with all passengers which includes the standard welcome handshake.

Operations:

- Will request a DHS Health questionnaire which includes past travel destinations.
- Have protocols set in place to further research origin and destinations for Covid-19 related restrictions for both crew and clients.
- Has implemented standards and protocols that provide for 'work from home' office hours to keep internal staff safe and available.

Aircraft:

- All aircraft have been equipped with personal protection equipment for both crew and passengers.
- Aircraft are stocked with digital thermometers on board and we have instructed crew to register their temperature twice daily and immediately report any temperature above 37.5°C/100°F.
- Additionally, the crew will use the digital thermometers to take the temperature of any passenger that Jet 60 determines to be traveling from a high-risk area or should they be displaying symptoms.
- Aircraft are sanitized after every flight with Aerocide and deep cleanings are scheduled regularly.
- All aircraft have been treated with an anti-microbial barrier treatment (by PreventX) that has an efficacy of 90 days on all the high traffic touch points in the aircraft. This gives you long-lasting protection. When applied, this treatment arrests the growth of microorganisms and harmful bacteria.

As we continue to monitor the COVID-19 situation with the CDC and WHO, we will continue to maintain the highest level of a safe, sterile environment to ensure the safety of our passengers as always.
